## Summary

DevOps and backend engineer with nearly 3 years building CI/CD pipelines, Kubernetes deployments and observability on Azure, AWS and on-premises servers. Recently fixed data-loss bugs in the failover path of KiviDB's Go Kubernetes operator, each proven with tests and runs under write load. Cut mean incident resolution time by about 50% with the LGTM observability stack.

## Experience

### DevOps Engineer — Adaptive Computer Solutions Ltd, Accra · Aug 2024 – present

- Build CI/CD pipelines on Azure DevOps and Azure Kubernetes Service (AKS) that build, test and release applications.
- Rolled out the LGTM observability stack (Loki, Grafana, Tempo, Prometheus) across production applications, cutting mean incident resolution time by about 50%.
- Deploy and troubleshoot web and USSD applications built in C#/.NET and React across several environments.
- Set up and administer PostgreSQL and MongoDB, including configuration, access control and backups.
- Monitor servers and live endpoints with Uptime Kuma, alerting to Microsoft Teams on downtime.
- Developing a Go CLI for on-premises CI/CD and operations: it deploys apps, backs up and restores apps and databases, and installs packages offline on air-gapped Linux servers over SSH.

### DevOps Engineering Intern — Adaptive Computer Solutions Ltd, Accra · Feb 2024 – Aug 2024

- Automated health monitoring of 12 Linux and 5 Windows servers with Bash and PowerShell, replacing manual checks.
- Deployed and configured applications and services in on-premises environments.

### Independent software development and study · Nov 2022 – Feb 2024

- Taught myself programming, cloud and DevOps through hands-on projects, then moved into a professional DevOps role.

## Open source

### KiviDB — Kubernetes operator (Go) and database engine (Rust) · Nov 2026 – present

- Made a failover hold the old master's writes before promoting a replica, so a force-deleted master no longer loses acknowledged writes (#77, merged).
- Made a switchover abort and retry when the engine cannot pause writes, instead of handing over without the pause (#82, merged).
- Made a failover pick the replica by its live offset and wait a capped time for a force-deleted master to come back on its volume (#83, merged).
- Engine: on start, remove the temporary dump files a cut-short save left behind (kividb#636, merged).
- Also merged: a refused bootstrap now shows in the cluster's status (#66), and `make deploy` honours `IMG` (#65). Two more are in review (#70, #71).
- Proved each fix with tests that fail without it and with kind clusters under write load: 0 acknowledged writes lost in force-delete runs of about 20,000 writes each.

### Kubernetes, GitOps and observability projects · Oct 2026 – present

- **Argo Workflows** (CNCF graduated): moved the workflow controller's operator test fixtures into testdata files (#17284, #17286 merged; #17289 in review).
- **Kargo** (Akuity): the `http` promotion step now checks failure criteria before success, so error responses report their failure message instead of an evaluation error (#7926, merged). The UI waits for a verification Job before asking for its logs (#7895, in review).
- **telemetry** (OpenTelemetry tracing for AI apps): tests for the AI SDK paths and the gateway's metric relabeling (#162, #169, #209 merged).

- **pgbot** (Postgres tooling for AI agents): no more warnings for unused drifted collations (#146, in review).

## Projects

### kvlite — in-memory key-value store (github.com/lofoneh/kvlite)

*Go (standard library only), Docker, GitHub Actions*

- An in-memory key-value store with a Redis-like protocol over TCP and per-key TTLs.
- Durability through a write-ahead log with crash recovery, and point-in-time snapshots that compact it.

### IaC Studio — visual infrastructure as code

*Go, Terraform, PostgreSQL, Redis, React*

- Turns a cloud architecture drawn on a canvas into Terraform for AWS, GCP, Azure or DigitalOcean, then runs plan and apply in background workers.
- Versioned designs, per-resource cost estimates, and live deployment status over WebSocket.

### GiftBanc — gift card platform (contract)

*Docker, Ansible, Traefik, GitHub Actions, DigitalOcean*

- Built and run the CI/CD and hosting for a live e-commerce gift card platform (giftbanc.com), working with one developer.
- Containerized deployments with Docker, automated provisioning with Ansible, and set up Traefik for load balancing and reverse proxying.

### WIN Transport Services — bus booking admin portal (contract)

*Next.js, TypeScript, Prisma, Zod, Vercel*

- Built the admin portal for a live bus-booking platform (wintransportservices.com) with one other developer.

### WIN Church administration platform (live)

*TypeScript, Next.js, Expo (React Native), Supabase, Turborepo*

- A multi-tenant church administration platform with role-based access, member and group management, and attendance reporting, live at win-admin-alpha.vercel.app.

## Skills

- **Cloud and infrastructure:** AWS (EC2, EKS, ECS, ECR), Azure (AKS, Azure DevOps, Blob Storage), DigitalOcean, Terraform, Ansible
- **Containers and Kubernetes:** Docker, Kubernetes, Helm, kind, Kubernetes operators (controller-runtime), Traefik
- **CI/CD and observability:** GitHub Actions, Azure DevOps, Prometheus, Grafana, Loki, Tempo, OpenTelemetry, Uptime Kuma
- **Languages:** Go, Rust, Python, TypeScript, Ruby, Bash, PowerShell
- **Databases:** PostgreSQL, MongoDB, Supabase, Redis and Redis-compatible stores (KiviDB)
- **Frameworks:** React, Next.js, Expo (React Native), Django, FastAPI, Gin, Prisma, Ruby on Rails

## Certifications and education

- AWS Cloud Practitioner
- Microsoft Azure Fundamentals (AZ-900)
- Introduction to FinOps (FinOps Foundation)
- Professional Foundations (ALX Africa)
- BSc Metallurgical Engineering, Kwame Nkrumah University of Science and Technology (KNUST), Kumasi · Aug 2018 – Nov 2022
